

Average	
Q.No	Answer
Type I	
1	<p>Correct Option: C</p> <p>So, let's make equation from the given information :</p> $\text{Average} = \left( \frac{66 + 74 + 55 + 92 + 79}{5} \right) = \frac{366}{5}$ <p>Average = 73.2% .</p>
Type II	
1	<p>Correct Option: B</p> <p>Multiples of 7 between 8 and 55 will be; 14, 21, 28, 35, 42, 49</p> $\text{Average} = \left( \frac{\text{First term} + \text{Last term}}{2} \right) = \frac{14 + 49}{2}$ <p>⇒ 31.5.</p>
2	<p>Correct Option: C</p> <p>Multiple of 5 are: 5, 10, 15, 20, 25. so,</p> $\text{Average} = \frac{\text{First term} + \text{Last term}}{2} = \frac{(5 + 25)}{2} = 15.$
3	<p>Answer: Option 'C'</p> <p>Let the Consecutive odd numbers are x , x + 2 , x + 4 , x + 6, x + 8.</p> <p>Given , Average of five Consecutive odd numbers = 35</p> <p>⇒ Average = (x + x + 2 + x + 4 + x + 6 + x + 8)/5 = 35</p> <p>⇒ (5x + 20) / 5 = 35</p> <p>⇒ 5x + 20 = 175</p> <p>⇒ 5x = 175 - 20</p> <p>⇒ 5x = 155</p> <p>⇒ x = 31 ---&gt; which is the first term of the given consecutive odd series.</p> <p>The numbers are 31, 33, 35 and 37, 39</p> <p>The greatest number is 39.</p>
4	<p>Answer: Option "B"</p> <p>Solution is :</p> <p>Average of first 30 natural numbers = ( n + 1 ) / 2</p> <p>= ( 30 + 1 ) / 2 = 31 / 2 = 15.5</p> <p>Average of first 30 multiples of 8 = ( Average of first 30 natural numbers ) * 8</p> <p>= 15.5 × 8 = 124.</p> <p>The average of first 30 multiples of 8 = 124.</p>
5	<p>Answer: Option 'C'</p> <p>Average of 34 numbers is = 0</p> <p>Therefore sum of all 34 numbers = 0</p> <p>It is quite possible that 33 of these numbers may be positive and if their sum is a then 34th number is (-a)</p>
6	<p>Correct Option: A</p> <p>Let the number be x. then,</p> $\frac{x + x^2}{2} = 7x$ <p><math>x^2 + x = 14x</math>, <math>x^2 - 13x = 0</math>, <math>x [ x - 13 ] = 0</math>, <math>x = 0, 13</math>.</p> <p>So the number is 13 .</p>
7	<p>Correct Option: C</p> <p>Let the smallest odd number be x</p> <p>so acc. to the que. the consecutive num are</p> <p>x, x + 2, x + 4, x + 6, x + 8, x + 10, x + 12.</p> <p>So the difference is x + 12 - x = 12.</p> <p>Hence, option C is correct.</p>
8	<p>Correct Option: C</p> <p>To solve this question, we can apply a short trick approach</p> $1^3 + 2^3 + 3^3 + \dots + n^3 = \frac{n^2(n+1)^2}{4}$

	<p>By the short trick approach, we get</p> $\frac{1^3 + 2^3 + 3^3 + \dots + 5^3}{4} = \frac{5^2(5+1)^2}{4} = \frac{5^2 \times 6^2}{4}$ $\Rightarrow \left(\frac{25 \times 36}{4}\right) = (25 \times 9) \Rightarrow 225.$ <p>So, Required average = <math>\left(\frac{225}{5}\right) = 45.</math></p> <p>Hence, option C is correct.</p>
9	<p>A</p> <p>Average for 100 odd nos is 100</p> $(1+199)/2 = 100$ $100 \times 100 = 10000$
<b>Type III</b>	
1	<p>(3) Sum of total number of 8 students in exam</p> $= 8 \times 51 = 408$ <p>Sum of total number of 9 students in exam</p> $= 9 \times 68 = 612$ <p>Required average = <math>408 + 612 / 17 = 1020 / 17 = 60</math></p>
2	<p>(1) Using Rule 10.</p> <p>The required average marks</p> $= \frac{55 \times 50 + 60 \times 55 + 45 \times 60}{55 + 60 + 45}$ $= \frac{2750 + 3300 + 2700}{160}$ $= \frac{8750}{160} = 54.68$
3	<p>Correct Option: D</p> <p>Since the month begins with a Saturday, So there will be five Sunday's in the month,</p> <p>Req. Avg. = <math>\frac{430 \times 5 + 270 \times 26}{31} \Rightarrow \frac{2150 + 7020}{31}</math></p> $\Rightarrow \frac{9170}{31} = 295.80 \approx 296.$ <p>So, the around value of visitors per day is 296.</p>
4	<p>Correct Option: C</p> <p>Reqd Avg = <math>\frac{18 \times 45.55 + 4 \times 35.25}{18 + 4} \Rightarrow \frac{819.9 + 141}{22}</math></p> $\Rightarrow \frac{960.9}{22} = 43.67 \text{ kgs}$ <p>Hence, option (C) is correct.</p>
5	<p>Correct Option: C</p> <p>First, we find out the normal ages of candidates:</p> <p><b>Grandparents(2 candidates)</b> = <math>56 \times 2</math></p> <p><b>Parents (2 candidates)</b> = <math>27 \times 2</math></p> <p><b>Two grandchildren</b> = <math>7 \times 2</math>.</p> <p>The total candidates are 6. then,</p> <p>Average = <math>\frac{56 \times 2 + 27 \times 2 + 7 \times 2}{2 + 2 + 2} \Rightarrow \frac{112 + 54 + 14}{6}</math></p>

	$= \frac{180}{6} = 30$ years
<b>Type IV</b>	
1	<p>Correct Option: A</p> <p>Total weight of 21 boys = <math>64 \times 21 = 1344</math> kg</p> <p>Given that if the weight of the teacher was added, the average increased by one kg</p> <p><math>\therefore</math> Total weight along with the teacher = <math>65 \times 22 = 1430</math> kg</p> <p>Now, teacher's weight = <math>1430 - 1344 = 86</math></p> <p>Hence, option (A) is correct.</p>
2	<p><b>Answer – C)70</b></p> <p>Explanation :</p> $\frac{x}{5} = 42 \Rightarrow 42 \times 5 = 210$ $\frac{x}{4} = 35 \Rightarrow 35 \times 4 = 140$ $210 - 140 = 70$
3	<p>Ans:= C</p> <p>Total weight increased = <math>(8 \times 2.5)</math> kg = 20 kg.</p> <p>Weight of new person = <math>(65 + 20)</math> kg = 85 kg.</p>
4	<p>Ans:- A</p> <p>Total = <math>(2 \times 8) + (35 + 45) = 16 + 80 = 96</math></p> <p>Average = <math>96 / 2 = 48</math></p>
5	<p>Correct Option: B</p> <p>Let the number of family members be x.</p> <p>Therefore, the total weight = xy</p> <p>Equation in the 1st scenario:</p> $(x + 1)(y + 1) = xy + 30$ $xy + x + y + 1 = xy + 30$ $x + y = 29 \quad \dots(i)$ <p>Equation in the 2nd scenario:</p> $(x + 1)(y - 1) = xy + 18$ $xy + y - x - 1 = xy + 18$ $y - x = 19 \quad \dots(ii)$ <p>Solving equations (i) and (ii), we get</p> <p><math>2y = 48</math>, Therefore, <math>y = 24</math>.</p> <p>Hence, option B is correct.</p>
6	<p>Correct Option: A</p> <p>Total age of 12 persons = <math>12 \times 32 = 384</math> years</p> <p>Given that if the age of one person is added, the average decreases by one year</p> <p><math>\therefore</math> Total age of 13 persons = <math>13 \times 31 = 403</math> years</p> <p>Now, age of new person = <math>403 - 384 = 19</math> years</p> <p>Hence, option (A) is correct.</p>
7	<p><b>Answer – D)74</b></p> <p>Explanation : <math>50 + (8 \times 3) = 50 + 24 = 74</math>.</p>
8	<p>Answer – D)76</p> <p>Explanation :</p> $\{(15 \times 75) - (35 + 46) + (38 + 63)\} / 15 = (1125 - 81 + 101) / 15$ $= 1145 / 15 = 76.33 = 76$
9	<p>Correct Option: C</p> <p>Total number of marks = <math>88 \times 6 = 528</math></p> <p>Now, <math>528 - 86 + 68 = 510</math></p> <p>Required average = <math>\frac{510}{6} = 85</math>.</p> <p>Hence, option C is correct.</p>
10	B
11	B
12	<p>Answer – A)75</p> <p>Explanation :</p> <p><math>P + Q + R = 84 \times 3 = 252</math></p>

	$P+Q+R+S = 4 \times 80 = 320$ $S = 320 - 252 = 68$ $Q+R+S+T = 79 \times 4 = 316$ $Q+R+2S+3 = 316$ $S = 68, Q+R = 177$ $P = 252 - 177 = 75$
<b>Type V</b>	
1	<p>Correct Option: C</p> <p>As per the given information, we get</p> <p>Average of 15 numbers = 7. So, total of the numbers = <math>15 \times 7 = 105</math></p> <p>Average of first 8 numbers = 6.5. So, total of the numbers = <math>8 \times 6.5 = 52</math></p> <p>Average of last 8 numbers = 9.5. So, total of the numbers = <math>8 \times 9.5 = 76</math></p> <p>Hence, the 8th number = <math>(52 + 76) - 105 = 128 - 105 = 23</math>.</p> <p>Hence, option C is correct.</p>
2	<p>Correct Option: D</p> <p>To solve this question we can apply a short trick approach</p> <p><b>Value of <math>\left(\frac{n+1}{2}\right)^{\text{th}}</math> result = <math>\left(\frac{n+1}{2}\right) \times (b+c) - n \times a</math></b></p> <p>Where</p> <p>n is the total number of term = 7 days</p> <p>b is the average of first four terms = 25</p> <p>c is the average of last four terms = 25.5</p> <p>a is the average of whole terms = 25.2</p> <p>By the short trick approach, we get</p> <p>Value of <math>\left(\frac{n+1}{2}\right)^{\text{th}}</math> result = <math>\left(\frac{7+1}{2}\right) \times (25 + 25.5) - 7 \times 25.2</math></p> <p><math>= \left(\frac{8}{2}\right) \times (50.5) - 176.4 \Rightarrow 202 - 176.4 = 25.6</math></p> <p><b>Traditional method:</b></p> <p>Total average of first 4 days = <math>4 \times 25 = 100</math></p> <p>Total average of last 4 days = <math>4 \times 25.5 = 102</math></p> <p>Total average of 7 days = <math>7 \times 25.2 = 176.4</math></p> <p>Temperature 4th day's = <math>100 + 102 - 176.4 = 25.6</math></p> <p>Hence, option D is correct.</p>
3	<p>Correct Option: B</p> <p>As per the given information, we get</p> <p>Average of 12 months = 3400. So, total salary of all 12 months = <math>3400 \times 12 = ₹ 40800</math> (eq. 1)</p> <p>Average of first 8 months = 3160. So, total salary of first 8 months = <math>3160 \times 8 = ₹ 25280</math> (eq. 2)</p> <p>Average of last 5 months = 4120. So, total salary of first 5 months = <math>4120 \times 5 = ₹ 20,600</math> (eq. 3)</p> <p>Person's income in the eighth month = <math>(25280 + 20600) - 40800 = 45880 - 40800 = ₹ 5080</math>.</p> <p><b>Note: In such questions, when we calculate total of two different sets (for instance, first 8 months + last 5 months), one particular value (8th month in this case) is calculated twice.</b></p> <p><b>On subtracting the total of eq. 1 from the total of eq. 2 and 3 we are left with the value of the month that's been calculated twice in the question.</b></p> <p>Hence, option B is correct</p>
4	D
<b>Type VI</b>	
1	<p>Correct Option: D</p> <p>Let the numbers are <math>2x, x, 4x</math>, then,</p> <p>Total of the numbers = <math>3 \times 56 = 168</math></p> <p><math>\Rightarrow 2x + x + 4x = 168</math></p> <p><math>\Rightarrow 7x = 168 \Rightarrow x = 24</math></p> <p><math>\therefore</math> Required difference = <math>4x - 2x = (4 \times 24) - (2 \times 24)</math></p> <p><math>\Rightarrow 96 - 48 = 48</math>.</p> <p>Hence, option D is correct.</p>

2	<p>Answer – <b>D.50</b></p> <p><b>Explanation :</b>  <math>(a+b)/2 = 25 + (b+c)/2</math></p>
3	<p>Correct Option: D</p> <p>We have to determine the average weight of A, B, C, F and J.</p> <p>But this can't be determined as we don't know the Score of J.</p> <p>Hence the data is inadequate to solve the given question.</p> <p>Therefore, option (D) is correct.</p>
<b>Type VII - Average Speed</b>	
1	<p><b>Answer:</b> Option <b>C</b></p> <p><b>Explanation:</b></p> <p>Total time taken = <math>\left( \frac{160}{64} + \frac{160}{80} \right) \text{ hrs.} = \frac{9}{2} \text{ hrs.}</math></p> <p><math>\therefore</math> Average speed = <math>\left( 320 \times \frac{2}{9} \right) \text{ km/hr} = 71.11 \text{ km/hr.}</math></p>
2	<p>Answer – <b>A. 24 kmph</b></p> <p><b>Explanation:</b></p> <p>Distance between home and Bank – x km</p> <p>Total distance = x + x = 2x</p> <p>Total time taken = <math>x/60 + (x/2)/10 + (x/2)/30 = x/12</math></p> <p>Average speed = <math>2x/(x/12) = 24 \text{ kmph}</math></p>
3	<p>Answer – <b>A. 18 kmph</b></p> <p>Explanation: <math>= 3 * 10 * 20 * 60 / (200 + 1200 + 600) = 18 \text{ kmph}</math></p>
<b>Type VIII -Cricket Based Questions</b>	
1	<p>Correct Option: C</p> <p>To solve this question, we can apply short approach</p> <p><b>Average after n innings = <math>x - y(n - 1)</math></b></p> <p>Where, x = 120; y = 5; n = 12</p> <p><math>\therefore</math> Required average = <math>120 - 5(12 - 1)</math></p> <p><math>= 120 - 55 = 65 \text{ runs}</math></p> <p>Hence, option C is correct.</p>
2	<p><b>Answer – B (37)</b></p> <p><b>Explanation</b> – Let the average after 16th innings be a, then total score after 17th innings =&gt;</p> <p><math>16a + 85 = 17(a + 3)</math></p> <p><math>a = 85 - 51 = 34</math></p> <p>Average after 17 innings = <math>a + 3 = 34 + 3 = 37</math></p>
3	<p>(3) Let the no. of wickets taken till the last match be n.</p> <p><math>\therefore</math> Total runs at 24.85 runs per wicket = <math>24.85n</math></p> <p>Total runs after the current match = <math>24.85n + 52</math></p> <p>Total no. of wickets after the current match = <math>n + 5</math></p> <p>Bowling Average after the current match</p> <p><math>\Rightarrow \frac{24.85n + 52}{n + 5} = 24.85 - 0.85</math></p> <p><math>\therefore \frac{24.85n + 52}{n + 5} = 24</math></p> <p>or <math>24.85n + 52 = 24n + 120</math></p> <p>or <math>0.85n = 120 - 52</math></p> <p>or <math>n = \frac{68}{0.85} = 80</math></p>

4	<p>(4) Required number of wickets = <math>x</math> (let)</p> <p>According to question,</p> $12.4 \times x + 26 = (x + 5) (12.4 - 0.4) = (x + 5) \times 12$ $\Rightarrow 12.4x + 26 = 12x + 60$ $\Rightarrow 12.4x - 12x = 60 - 26$ $\Rightarrow 0.4x = 34$ $x = 34/0.4 = 85$
<b>Type IX-Problems on Ages</b>	
1	<p>Correct Option: E</p> <p>The total age of all family members = <math>30 \times 14 = 420</math></p> <p>New baby born and after 4 years the total age of all the members = <math>420 + 15 \times 4 = 420 + 60 = 480</math></p> <p>Reqd average = <math>\frac{480}{15} = 32</math> years</p> <p>Hence, option E is correct.</p>
2	<p><b>Answer – B (2 years)</b></p> <p><b>Explanation</b> – Total age of 5 members, 3 years ago = <math>(17 \times 5)</math> years = 85 years</p> <p>Total age of 5 members now = <math>(85 + 3 \times 5)</math> years = 100 years</p> <p>Total age of 6 members now = <math>(17 \times 6)</math> years = 102 years</p> <p>Age of the baby = <math>(102 - 100)</math> years = 2 years</p>
3	<p>(1) Sum of the present ages of A, B and C</p> $= (51 \times 3 + 3 \times 7) \text{ years}$ $= (153 + 21) \text{ years} = 174 \text{ years}$ <p>Again, <math>A = B + 3 = C + 6</math></p> $B = C + 3$ $A + B + C = 174$ $\Rightarrow C + 6 + C + 3 + C = 174$ $\Rightarrow 3C = 174 - 9 = 165$ $\Rightarrow C = 165/3 = 55 \text{ years}$ $A = C + 6 = 55 + 6 = 61 \text{ years}$ $B = C + 3 = 55 + 3 = 58 \text{ years}$
<b>Type X</b>	
1	<p>Answer – E. <b>7344</b> <b>Explanation:</b> Total expenditure = <math>459x</math> 36 students joined then total expenditure = <math>459x + 81</math> average = <math>459x + 81/495 = x - 1</math> <math>x = 16</math> original expenditure = <math>16 \times 459 = 7344</math></p>
2	<p>Answer – E. <b>Rs.552</b> <b>Explanation:</b> <math>54 \times (x - 1) - 46 \times x = 42</math> <math>8x = 96</math> <math>x = 12</math> Original total expenditure: <math>46 \times x = 46 \times 12 = \text{Rs.}552</math></p>
